A close-up photograph of a person's hands. One hand is holding a black credit card, and the other is typing on a silver laptop keyboard. The background is blurred, showing the person's face and upper body. The image is partially obscured by a white circular graphic on the left side of the slide.

Pybandit: A Website Optimization Framework for E-commerce SMBs

Abir Das
Tuhin Sharma

Who we are

**MSc(OR) Student
@DU**

**Sr Principal Data Scientist
@RedHat**

Agenda

- ❖ Problem statement
- ❖ Big Company vs SMBs
- ❖ Existing Approach (AB Testing)
- ❖ Problems with existing approach
- ❖ Pybandit Approach (Multi Armed Bandit)
- ❖ AB Testing vs Multi Armed Bandit
- ❖ Advantages of Pybandit
- ❖ Demo

Problem statement

Merchants, with the help of their digital partners, know how to get traffic to their online shop

Digital Marketing Spend

Facebook, Instagram and Google have sophisticated algorithms to help merchants get the most relevant traffic for their ads

Offline vs Online

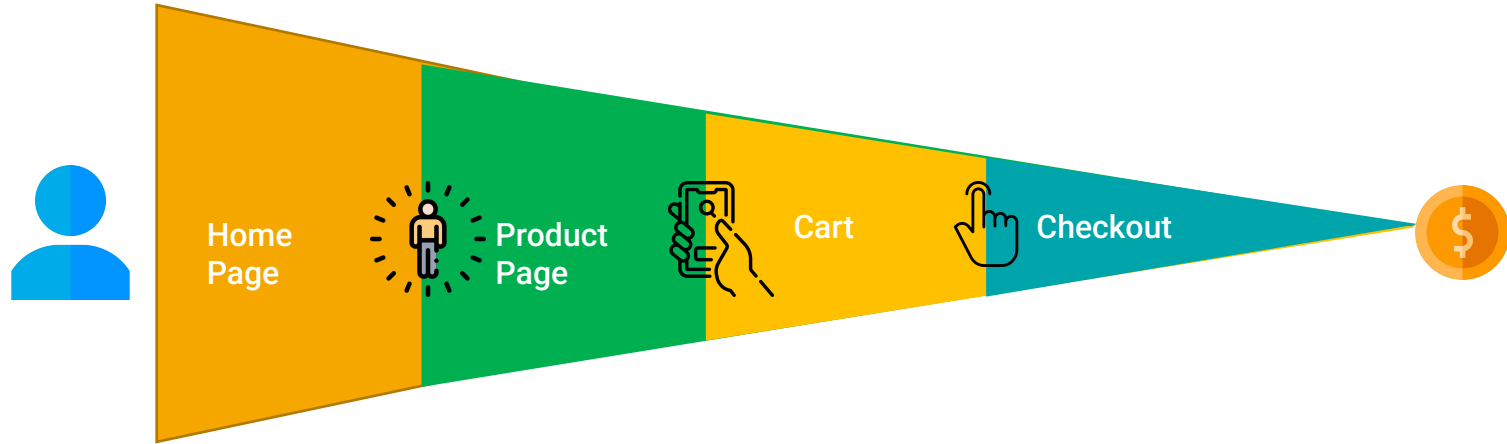

**Brick & Mortar
conversions
> 20%**

**But eCommerce
conversions
< 2%**

**Offline stores have greater conversion
rate than online counterpart**

This happens because the website is made to work harder and not smarter.

Website, is not refined and updated regularly.

Ineffective store

Very low conversion

The situation has worsened as well as become extremely critical in the current pandemic era

Consumers have rapidly embraced digital

Both brick & mortar and digital-native companies are adjusting to eCommerce reality

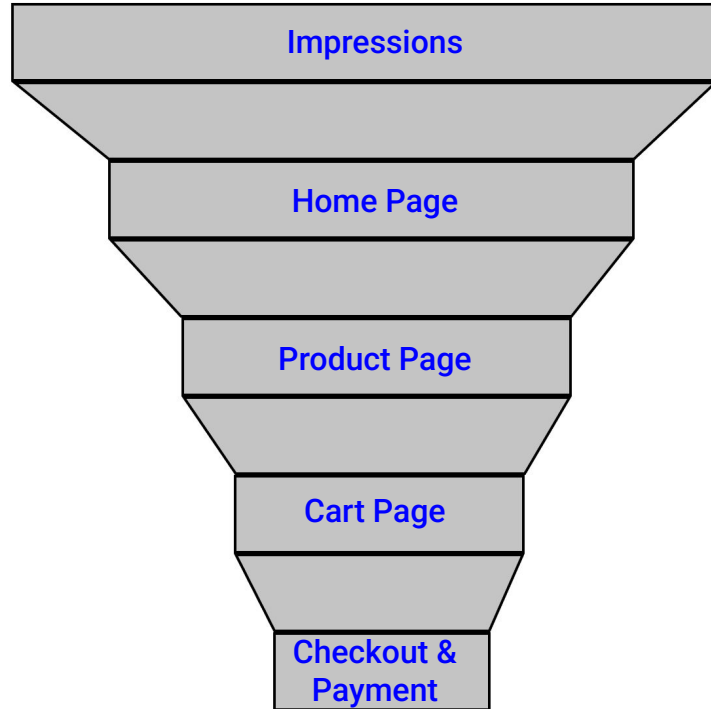

Marketing budget is squeezed

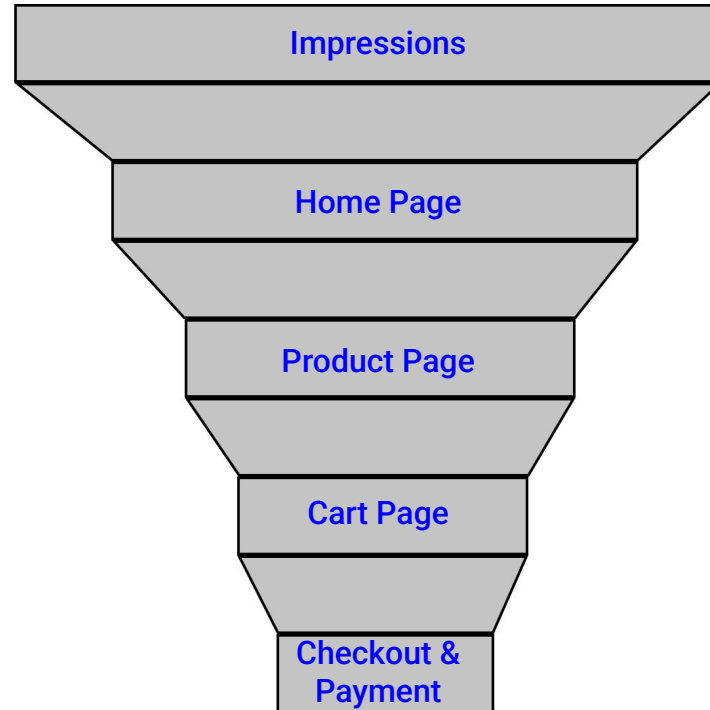

Advantages of Big Companies

Customer Funnel

Customer Funnel: Big Ecommerce Business

Google, Facebook,
Instagram ad

Customer Funnel: Small & Medium Ecommerce Business

Big Business vs Small & Medium Business

Big Companies have in-house teams of Data Scientists, ML engineers to enhance conversion

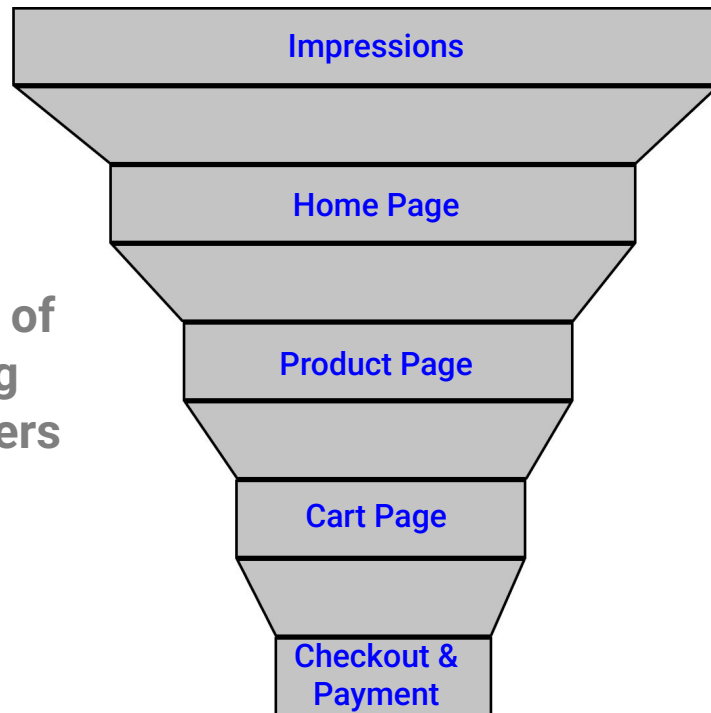

Pybandit is here to rescue

Google, Facebook,
Instagram ad

Pybandit

Shopify,
Bigcommerce etc.

focuses on the middle of
the customer shopping
journey for SMB retailers

Pybandit is here to rescue

Pybandit helps
you optimize

Design

Messaging

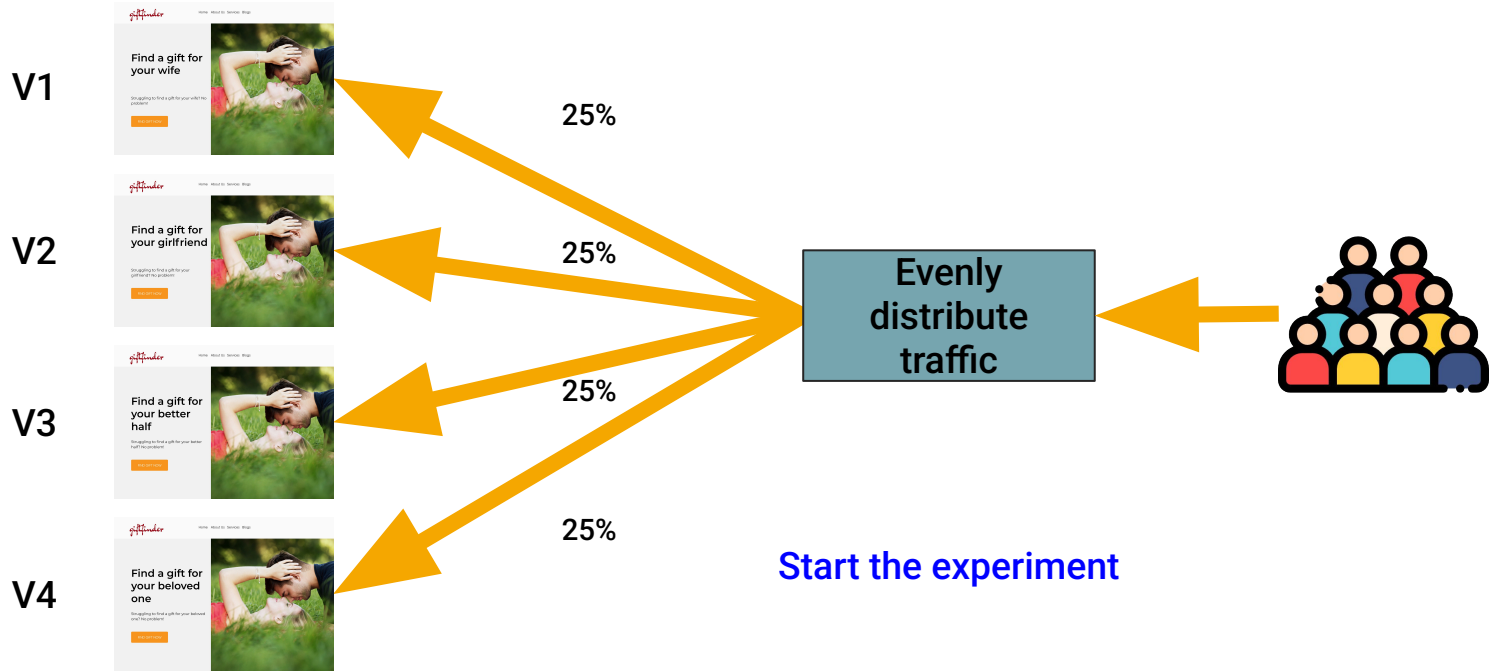

Pricing

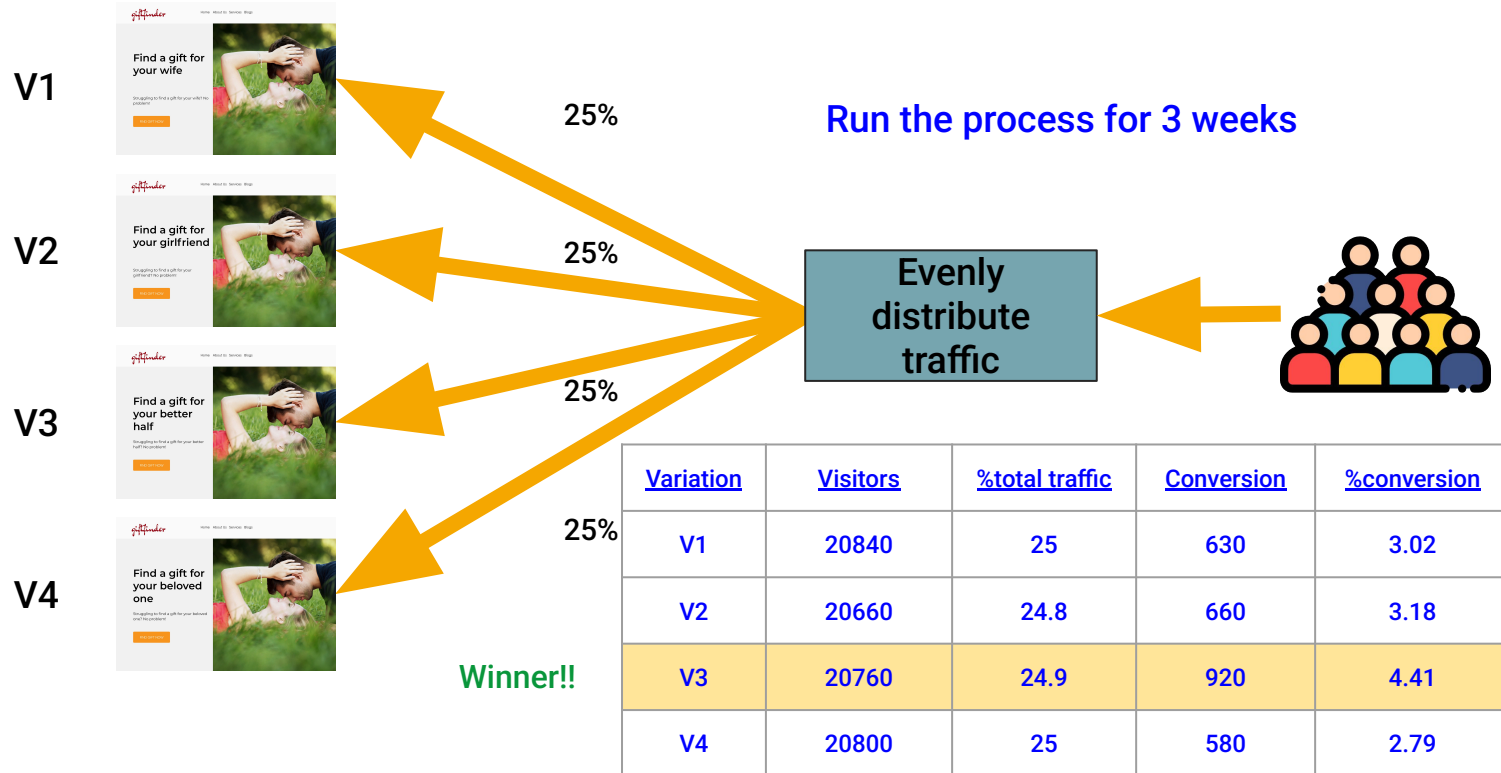

Existing Approach (AB Testing)

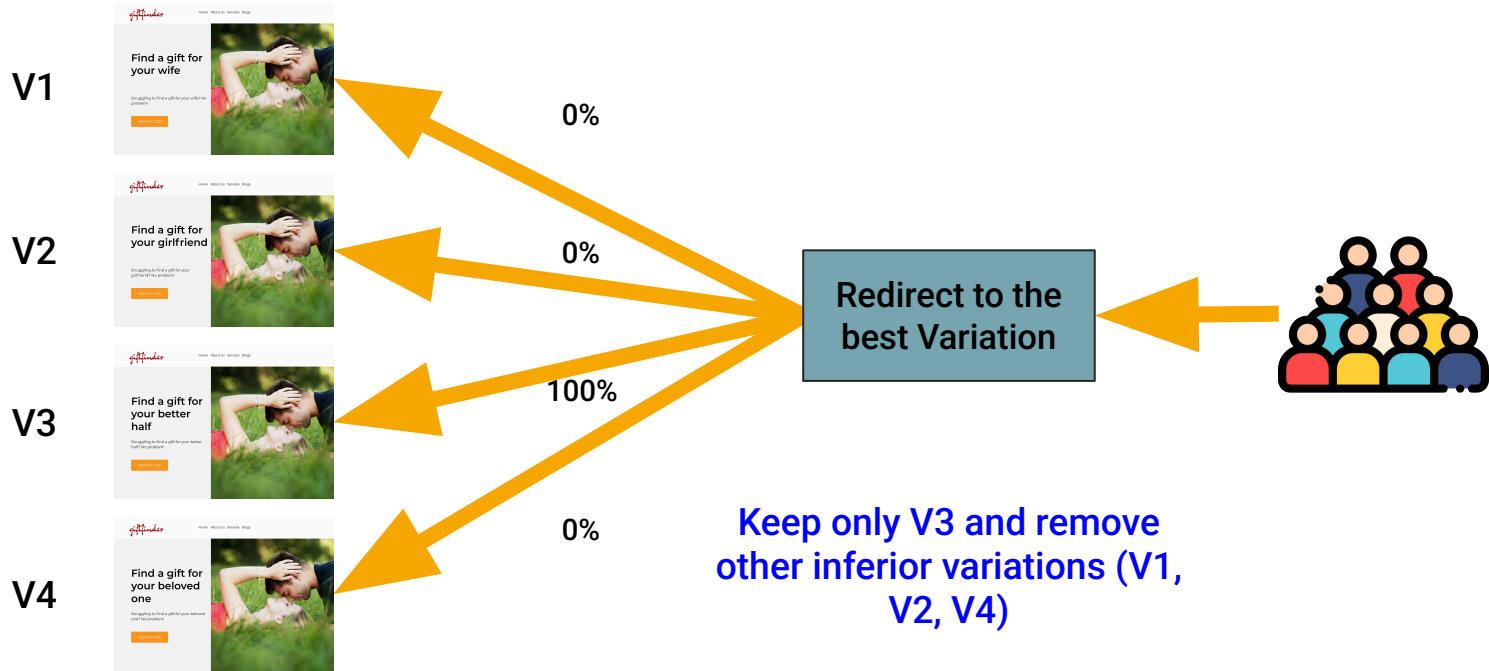

Existing Approach Step 1 : Split

Existing Approach Step 2 : Explore

Existing Approach Step 3: Exploit

Disadvantages of Existing Approach

AB Testing is not ideal for SMBs

Low traffic,
hence longer
time to
conclude.

Fear of missing
out as wrong
variations are
dominant

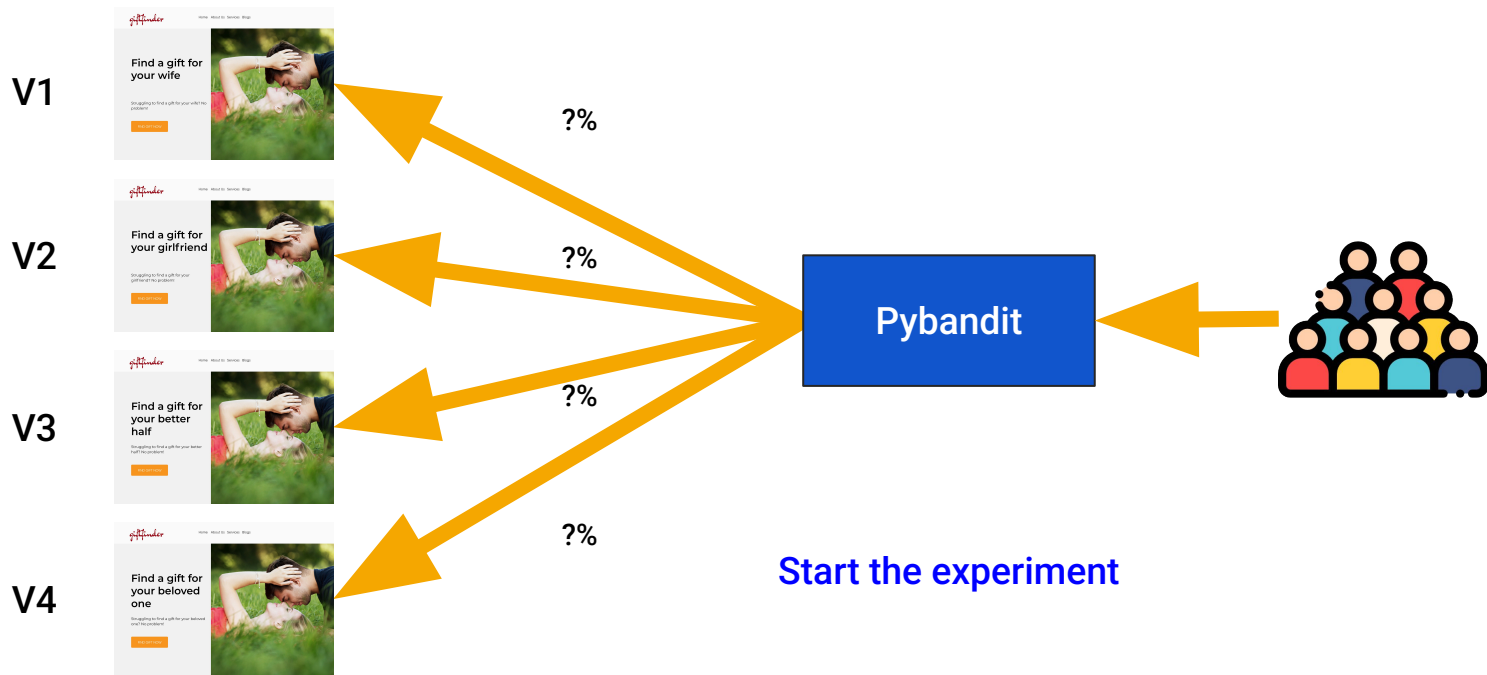

Fast moving
business can't
afford sequential
experiments

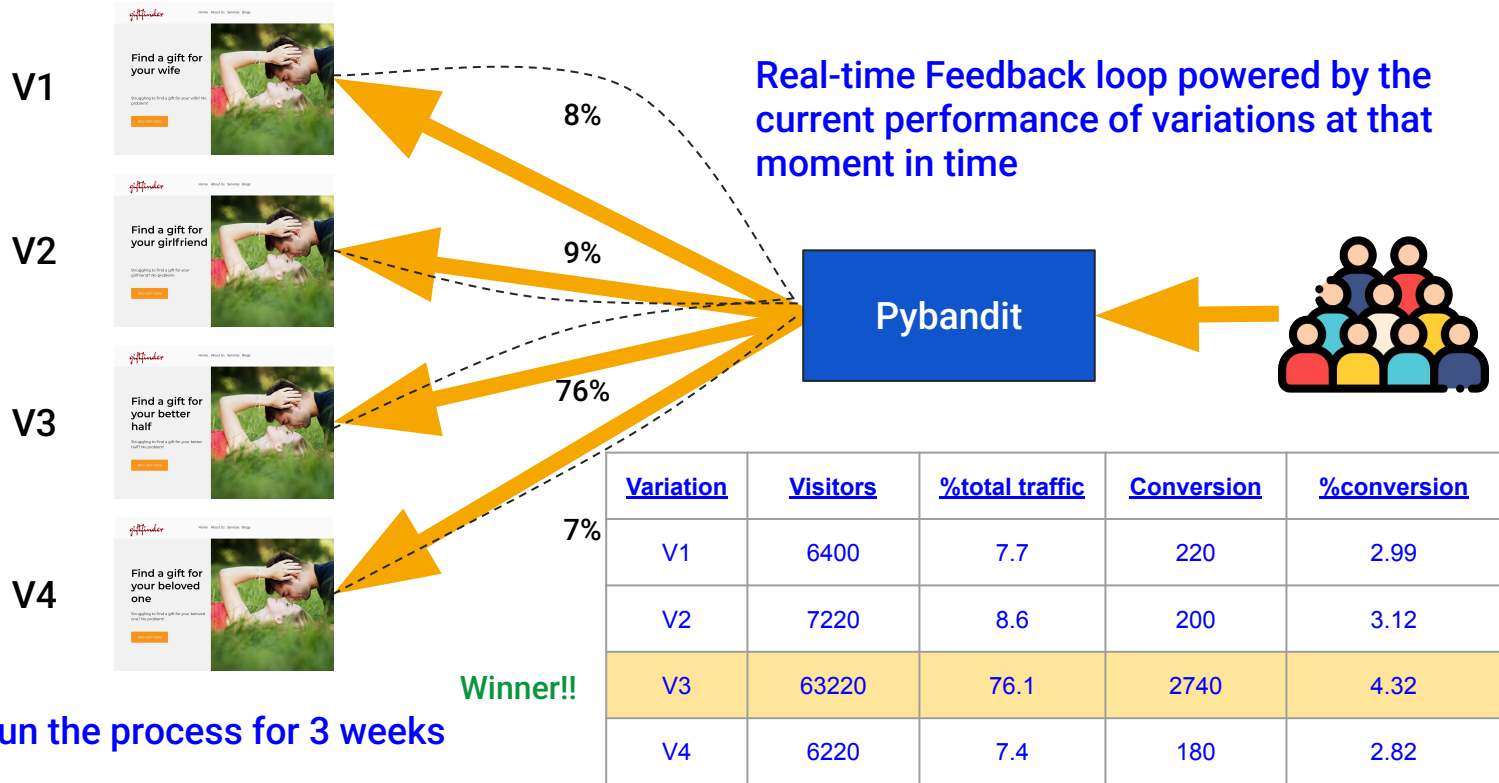

Pybandit Approach (Multi Armed Bandit)

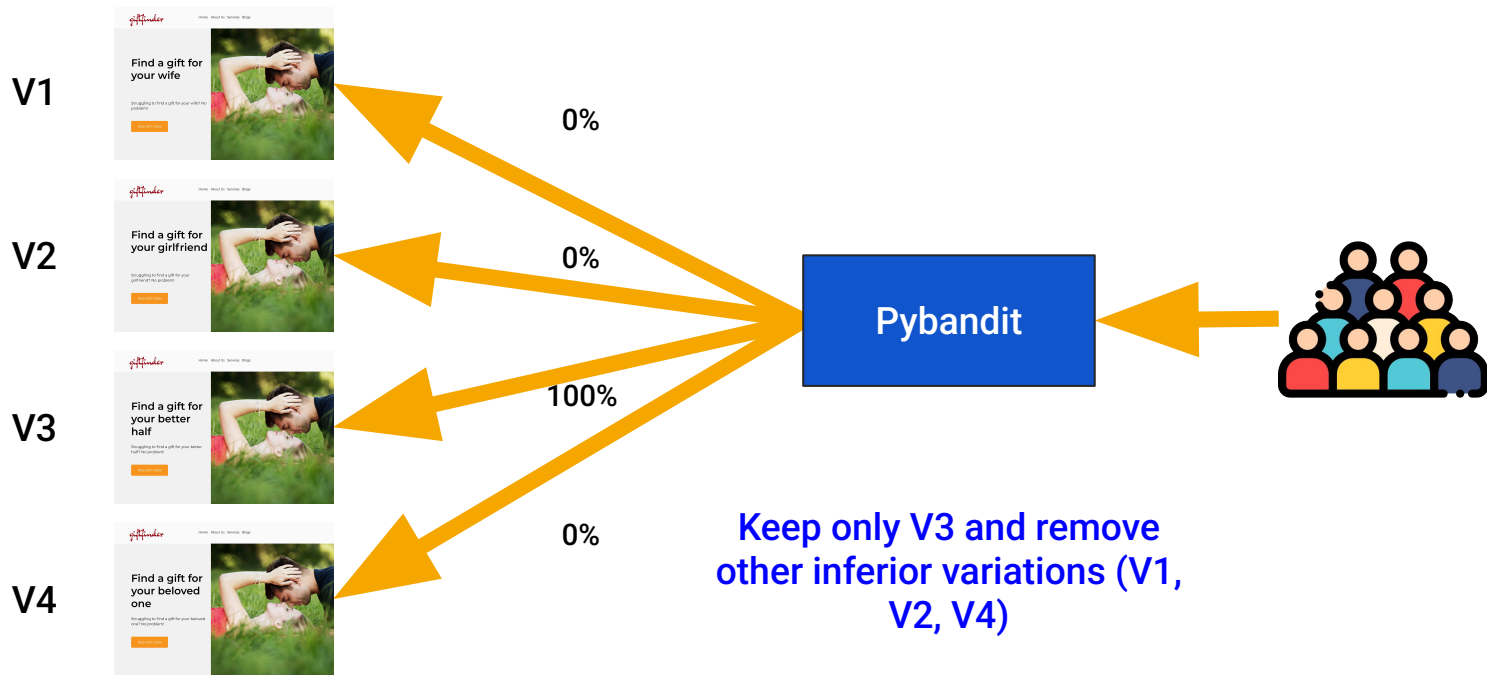

Pybandit Approach Step 1 : Realtime Split

Pybandit Approach Step 2 - Explore with Feedback

Pybandit Approach Step 3: Exploit Automatically

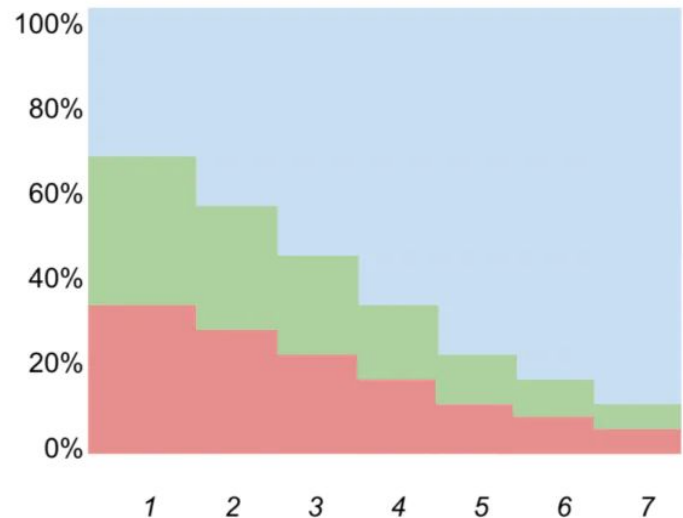

AB Testing vs Multi Armed Bandit

Pybandit maximizes revenue during exploration

AB Testing
(Exploit follows
Explore)

MAB
(Explore and Exploit happens
simultaneously)

Advantages of Pybandit

Pybandit maximizes revenue during exploration

Existing Approach

<u>Variation Type</u>	<u>Variation</u>	<u># Impressions</u>	<u>% of traffic served</u>
best	V3	20760	25
worse	V1, V2, V4	62300	75

Pybandit Approach

<u>Variation Type</u>	<u>Variation</u>	<u># Impressions</u>	<u>% of traffic served</u>
best	V3	> 58140	> 70
worse	V1, V2, V4	< 24920	< 30

	<u>Conversion</u>	<u>% Conversion</u>
<u>Existing Approach</u>	2790	3.35
<u>Pybandit Approach</u>	3330	4.0

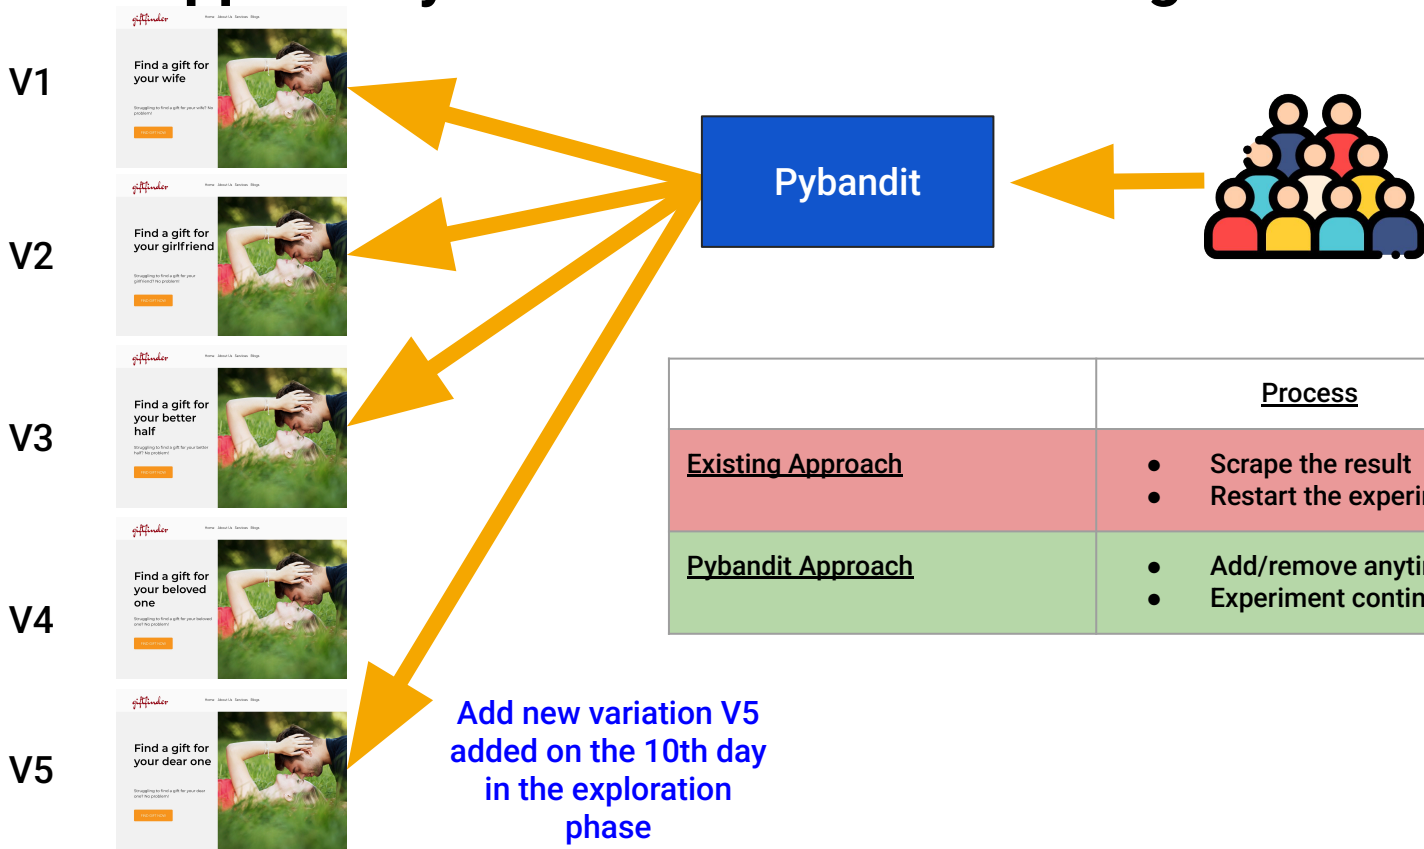

- Increase in Conversion ~ 20%
- Each conversion - \$100,
Increase in Revenue = \$ (3330-2790) * 100 = \$54,000

For the whole Exploration phase (3 Weeks)

Pybandit auto-detects completion of exploration

	<u>Detect Completion of Exploration</u>	<u>Switch to best variation</u>
<u>Existing Approach</u>	Human intervention needed	Takes 4-5 business working days for the development team
<u>Pybandit Approach</u>	Automatic Notification	Automatic Redirection

Pybandit supports Dynamic Multivariate Testing

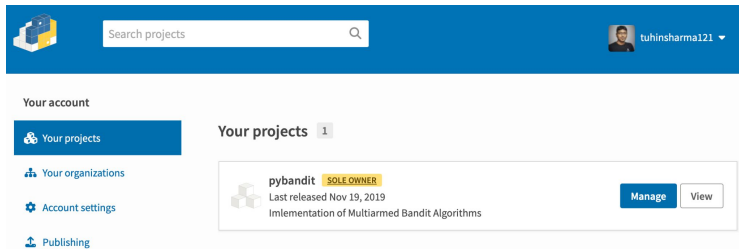

Remove V4 on the 5th day in the exploration phase

Add new variation V5 added on the 10th day in the exploration phase

Demo - Pybandit Library

Pybandit is in active development and available in Pypi

The screenshot shows the PyPI user profile for 'tuhinsharma121'. At the top, there is a search bar and the user's name with a dropdown arrow. Below this, there is a 'Your account' section with links for 'Your projects', 'Your organizations', 'Account settings', and 'Publishing'. The 'Your projects' section shows a single project named 'pybandit', which is the 'SOLE OWNER'. The project details include 'Last released Nov 19, 2019' and 'Implementation of Multiarmed Bandit Algorithms'. There are 'Manage' and 'View' buttons for the project.

<https://github.com/tuhinsharma121/pybandit>

pybandit

A Python library for all popular multiarmed bandit algorithms.

Roadmap

The following algorithms are currently being explored before we set a roadmap for the first release.

1. Epsilon Bandit:
 - i. Epsilon-greedy strategy (done)
 - ii. Epsilon-first strategy (in progress)
 - iii. Epsilon-decreasing strategy
 - iv. Epsilon-adaptive strategy
2. Bayesian Bandit
 - i. Thompson Sampling
3. Contextual Bandit
 - i. Linear Classifier
 - a. LinUCB (Upper Confidence Bound) algorithm:
 - b. LinRel (Linear Associative Reinforcement Learning) algorithm:
 - ii. Non-linear Classifier
 - a. UCBogram algorithm
 - b. NeuralBandit algorithm
 - c. KernelUCB algorithm
 - d. Bandit Forest algorithm
 - iii. Constrained
 - a. UCB-ALP algorithm
 - iv. Greedy
 - a. Contextual-Epsilon-greedy strategy
4. Adversarial Bandit
5. Dueling Bandit
6. Collaborative Bandit
 - i. COFIBA

Thanks
